(a) factors against a fixed coupling scale
a priori
(learning window)
late data (oracle)
state 1 dotted,
state 2 dash-dot
q=0 Z_i
q=0 Z_iZ_j
q=0 flip-flop
all 435
calibration factor, t > 1.5 ms
fixed scale λ of all two-body couplings
(b) chance spread of the factor
q=0 Z_i
q=0 Z_iZ_j
q=0 flip-flop
all 435
grey: 5-95% if the band were exact
Xb15uf as learned
λ = 1.040 (a priori)
calibration factor, t > 1.5 ms
(c) neutral error against time, both states
λ = 1 (Xb15uf as learned)
λ = 1.040 (a priori)
λ = 1.069 / 1.104 (late data, in-sample)
neutral z-score (rms deviation / rms spread)
t (ms)
